

IAASSE Content Studio

Prompt Documentation

1. Purpose

The IAASSE Content Studio uses AI to help the IAASSE communications/social media team turn a short content brief into social-media-ready ideas. The tool is designed to make content creation faster while keeping the output clear, human, relevant, and aligned with the selected platform, content type, and tone.

2. User Inputs

Input	Purpose
Brief / topic	Provides the context and key information the content should communicate.
Platform	Determines the style and format appropriate for LinkedIn, Instagram, X/Twitter, or Facebook.
Content type	Determines the purpose of the post, such as Announcement, Thought leadership, Event invitation, or
Tone	Controls the communication style: Informed & warm, Clear & direct, Reflective, or Energising.

3. AI Outputs

- **Caption:** A platform-appropriate social-media caption based on the brief.
- **Hashtags:** Relevant hashtags intended to support discoverability and topic relevance.
- **Content angles:** Three possible directions for developing additional posts or formats.

4. Core Prompting Principles

- Treat the user's brief as context, not as text to copy verbatim.
- Understand the complete meaning of the brief before writing.
- Write naturally and avoid generic AI filler.
- Do not repeat the organization name or topic unnecessarily.
- Do not invent details that are not present in the brief.
- Adapt wording and structure to the selected platform.
- Make the content type clear in the generated output.
- Match the selected tone without producing awkward phrases.
- Generate content angles that are specific to the actual brief rather than reusing generic templates.
- Produce grammatically correct, complete, review-ready content.

5. Prompt Structure

The generator combines the user's four selections into the AI instruction: **brief + platform + content type + tone**. The AI is then instructed to produce the requested outputs while following IAASSE's communication style.

6. Prompt Development and Refinement

Initial testing showed that the AI sometimes repeated the user's brief directly or produced generic wording. The prompt was refined to treat the brief as semantic context rather than copy, avoid verbatim repetition, avoid invented event names, and make the output more specific to the selected platform and content type. Additional testing was performed using different topics, platforms, content types, and tones.

7. Example Workflow

Step	Action
1	User enters a short brief.
2	User selects a social platform.
3	User selects a content type.
4	User selects a tone.
5	The AI interprets the brief and selections.
6	The AI generates a caption, hashtags, and three content angles.
7	User reviews and edits the output before publishing.

8. Testing Evidence

The prototype was tested by 5 users across LinkedIn, Instagram, Facebook, and X/Twitter. The feedback showed that most testers found the tool easy to use and that the generated content was generally useful. The user-testing results were documented separately in the IAASSE User Testing Feedback Report.

9. Human Review

The generated content is intended as a starting point for the IAASSE communications team. Users should review facts, wording, hashtags, links, names, dates, and calls to action before publishing.
